

KNS Biotin 100 Zn aids in conditioning and repair of the faulty or substandard equine hoof.

When it comes to equine hoof maintenance and/or repair the very best B-Vitamin is d-Biotin. Zinc is important for the epithelial tissue development. Zinc is also a major trace element needed for hoof growth and repair that starts at the cellular level. With Albion's MAAC® Zinc Amino Acid Chelate you can be confident that the Zinc is getting through the cellular wall and absorbed where repair is needed. Remember, Biotin is a vitamin and Zinc is a trace element, they will not work over night. They have to work from the inside out.

Stronger and harder hooves can be achieved and maintained by feeding **KNS Biotin 100 Zn**.
